

SERIES 740XXX

REUSEABLE PIEZOELECTRIC ICP® STRAIN SENSOR

- Frequency response from 0.5 Hz to 100 kHz
- ICP® amplified output for low noise operation over long cable lengths
- Reuseable mounting with super glue
- Integral cable, no soldering required
- Low mass of 0.5 grams

TYPICAL APPLICATIONS

- Ground Vibration Testing
- Modal Analysis
- Transfer Path Analysis
- Active Vibration Control

CE

FOR DYNAMIC TESTING OF AIRCRAFT, DEFENSE VEHICLES AND COMPONENTS

Re-usable ICP® Piezoelectric strain sensors can be used in modal analysis to assess structural integrity of aircraft during ground vibration testing and flight testing to determine high stress levels. They may also be used for measurement of strain-displacement relationships and load predictions.

Often used to supplement accelerometers, the small size of Series 740 strain sensors minimizes interference with aerodynamic properties of aircraft for flight test measurements. For applications where low strain levels occur, series 740 piezoelectric ICP® strain sensors generate output ten thousand times larger than the output of a resistive strain gauge. Its high sensitivity provides up to ± 5 volts output at ± 100 micro-strain.

The sensor mounts fast and easy to painted metals, composites, plastics and other materials in the field with gel-type super glue, and may be re-used multiple times or reapplied if alignment is not correct on the first application. Removal is simplified with a debonding agent and supplied removal tool. The strain sensor is also supplied with a calibration certificate.
