RUGGED SENSORS FOR HIGH SHOCK & EXTREME HEAT

Engine and powertrain NVH testing pushes sensors to their limits—high shock, extreme heat, and unrelenting vibration all demand exceptional resilience. PCB meets these challenges head-on with a portfolio of electrically filtered and thermally stable sensors, precision-engineered for the harshest powertrain environments.

ELECTRICALLY FILTERED FOR HIGH-SHOCK APPLICATIONS

In powertrain and driveline testing—whether for internal combustion and electric systems—mechanical shock can overwhelm unfiltered sensors, saturating signals and skewing results. PCB's electrically filtered sensors feature integrated low-pass filtering to suppress resonance from piezoelectric crystals, delivering clean, accurate measurements even in high-shock scenarios like gear impacts or sudden load changes.

THERMALLY STABLE FOR EXTREME TEMPERATURES

Extreme heat can destabilize sensor output, introducing errors that undermine data quality. PCB counters this with thermally stable solutions, including UHT-12® crystal technology for broad temperature sensitivity and low temperature coefficient (LTC) designs for precision up to 356°F (180°C). Housed in hermetically sealed titanium, these sensors reduce noise and strain interference, providing steady performance in conditions that challenge typical accelerometers.

ACOUSTIC SENSORS FOR NOISE SOURCE IDENTIFICATION

PCB microphones—available in a variety of prepolarized, externally polarized, array, probe, and special-purpose designs—excel at tests such as buzz, squeak, and rattle (BSR), noise path/transfer path analysis (NPA/TPA), and pass-by noise. Challenging measurement environments such as under-hood and in wheel-well can easily be addressed with microphones specially designed for use in extreme temperatures, high humidity and dirty environments. Prepolarized microphones simplify setups with common coaxial cables and ICP® compatibility, and all PCB microphones include TEDS for reduced configuration time.
